DEER CREEK® SEED BY DLF

Silver Screen Food Plot Mix

Food Plot

SEEDS & SCIENCE

Description

Silver Screen was developed to provide privacy and safety for your deer population. This formula restricts the view of outsiders like predators and noisy neighbors, making your deer feel safe. Silver Screen provides a food resource, and its height (8 - 12 ft.) and density will restrict visual penetration. This mix works well when planted in 10- to 20-foot strips along roadsides, food plot edges, and for dividing larger food plots into a more isolated, secure setting to relieve some of the nervousness animals have when being fully exposed. This mix will require application of some fertilizer, especially nitrogen.

Key Features

- Provides privacy for deer
- Restricted visual penetration makes animals feel safe
- Sorghum and wheat provide carbohydrates for energy
- Does require supplemental fertilizer
